

Workflow Conformance Review

WinTrack · ModAE Sales Platform — implementation measured against the two official process diagrams

REFERENCE DOCUMENTS	01 Official Lead Management Workflow — “Expected Lead Management Workflow Post Implementation” 02 Opportunity Workflow, 7 Jun 2026 — “02 – Opportunity Management Workflow (FINAL)”
SCOPE	Full source review of the WinTrack v2 application — pages, state store, gating rules, approval logic, AI tasks and integrations
DATE	18 August 2026
STATUS	Assessment only — no code was modified in producing this document

HEADLINE FINDING

~60% Diagram 01 — Lead Management The backbone is correct. Inbox → AI parse → classify → gate → Opportunity ID → SharePoint folder all work as drawn. The gaps are missing edges: lead sources, region routing, the Teams chatbot, the one-week timer and the fast-track path.	~35% Diagram 02 — Opportunity Management The divergence is structural, not cosmetic. The diagram’s primary axis — Greenfield versus Brownfield — does not exist in the data model, the B-01...B-05 steps are not tracked, the service site-survey flow is absent, and the margin approval matrix uses entirely different logic.
---	--

How to read this document.

Each section walks one lane of the diagram from left to right. “What the diagram says” is the official process. “What we actually built” cites the file and line that implements — or fails to implement — it.

MATCHES

PARTIAL

MISSING / DIFFERENT

Lane 1 — Lead Sources

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
Seven distinct sources: Website Enquiry, OEM Referral, WhatsApp, Phone Call, GeM / Tender Portal, Networking & Relationship, Existing Green Customer	A single free-text <code>source</code> field on the lead. Every lead carries <code>'Common mailbox'</code> . Searching the source tree for WhatsApp, phone call, networking or OEM referral returns zero results . The source filter in the inbox is built from whatever strings happen to exist, not from a defined list.	MISSING No source taxonomy. Reporting by channel is impossible today.
Common Sales Mailbox is “the single source of truth for all leads entering the AI ecosystem”	The Lead Inbox is styled as the common mailbox and even carries the header text. But nothing polls a mailbox . Leads arrive three ways: an operator pastes an email into a modal, a “Simulate incoming inquiry” button injects a fixed demo lead, or a tender PDF is uploaded manually. Microsoft Graph is wired for SharePoint file storage only — the requested scopes do not include mail access.	PARTIAL The destination exists; the pipe into it does not.

Lane 2 — Manual Lead Screening & the Human Qualification Gateway

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
L-01 Receive Lead → L-02 Initial Review → L-03 Business Relevance Assessment → D-01 Worth Pursuing?	All four collapse into one button: “Qualify lead” . None of the stage names exist in the code. There is no record that an Initial Review or a Business Relevance Assessment took place, and no separate reviewer.	DIFFERENT Four auditable checkpoints became one un-auditable click.
Discard Lead on a “No” at D-01	Implemented well. Disqualifying requires a category from a fixed list <i>and</i> a mandatory written note.	MATCHES
“Discarded leads shall be archived and maintained in a separate Lead Database for analytics, re-engagement and AI training”	Discarded leads stay in the same array with their status set to Dropped. There is no separate archive, no retention policy, and no screen that consumes them.	PARTIAL Data is kept but not separated or used.
Two intake routes: forward to the mailbox if already email, or fill a Lead Entry Form if not	Both exist in spirit — a paste-an-email modal and a manual intake form — but the two forms capture different field sets , and the form route bypasses the lead inbox entirely, creating an opportunity directly.	PARTIAL

Lane 3 — L-04 Information Required & L-05-AI Region Validation

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
L-04 four information blocks: Lead Information (with Opportunity Type entered manually), Customer Information, RFQ Information, Known Project Information	The intake form has three groups — Customer Info, Opportunity Details, Classification — covering most fields. RFQ number and RFQ date exist on the manual form only ; the registration path from a lead never captures them. There is no Known Project Information block at all.	PARTIAL Two of four blocks are complete.
L-05-AI Region validation routing ownership: North & West India → RS South & East India → PP Big & miscellaneous → LJS International → LJS Aerospace / DCS / Automation → LJS Unclassified → LJS (approval needed)	The rules exist as configuration text and are pasted into the AI prompt as a hint — but no code maps a region to an owner , and there is no region field on a lead at all . When the model does not return a valid owner, the fallback routes by opportunity type instead (Project→LJS, Spares→PJS, Service→SS ...) — a completely different rule to the one drawn.	DIFFERENT This is the single largest lead-flow divergence.

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
Ownership “may be manually overridden by LJS or AH when required”	The screen displays the sentence “override needs LJS/AH + reason”, but the Owner dropdown is freely editable by any user , with no role check and no reason field.	NOT ENFORCED

Lane 4 — AI Parsing & Validation

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
AI-01 Read / parse shared email or filled form AI-02 Extract RFQ metadata per CRM column headings AI-03 Check missing information	Genuinely built, and the strongest part of the system. A server-side Gemini task returns a structured result: summary, route, urgency, a completeness score, a suggested owner, and per-field values each carrying a confidence score and an evidence quote, plus explicit missing-information and next-action lists. Attached PDFs are text-extracted in the browser first. A deterministic keyword fallback runs if the AI is unavailable.	MATCHES and exceeds the diagram — every field is presented for Accept / Edit / Reject with evidence.
D-02 Information Complete?	Enforced: registration is blocked while any AI-proposed field is still unreviewed and below the confidence threshold.	MATCHES
AI-C1 Automated clarification mail sent from the common email only , customer replies with additional inputs, loop back to AI-01	Clarification drafting exists — but on the opportunity , after registration, not on the lead. Sending is simulated: the app logs a communication entry and shows “(simulated)”. No email is ever sent and no reply is ingested, so the loop back to AI-01 cannot close.	DIFFERENT Right feature, wrong stage, and the loop is open-ended.
Duplicate checking (named in the Fast Track lane)	Built and deterministic: exact buyer-reference match, or same sender with overlapping subject tokens, with Open / Not-a-duplicate / Mark-duplicate actions.	MATCHES

Lane 5 — Customer Classification

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
AI-04 classify Green / Blue / Amber / Red	The four classes exist throughout and drive real gates. But classification is not computed — it comes from the customer master, and the “upload accounting extract” button is a placeholder. An unmatched customer is auto-created as Blue.	PARTIAL Classes are real; the classifier is not.
Green → proceed, no additional action	Correct — Green raises no blockers.	MATCHES
Blue → send KYC form. Documents required: GST, PAN, cancelled cheque, EFT mandate	The four documents are listed as a checklist of names . There is no KYC form, no GST or PAN number capture, no validation, and uploads in the customer portal are simulated. Incomplete KYC does correctly block the proposal.	PARTIAL The gate works; the form behind it does not exist.
Amber → send pre-quote processing fee request	Built: a configurable fee of ₹25,000 with a 7-day window, a blocker on registration until paid, and a payment toggle in the customer portal.	MATCHES (payment itself is simulated — no gateway)
Red → Approval Request to LJS / AH → Approved? → No: Discard Lead	Built, and the most complete gate in the app: a joint LJS + AH clearance that blocks qualification and withholds the Opportunity ID, with per-approver decision tracking.	MATCHES
“Customer shares KYC / pays quote fee within 1 week ” → otherwise Discard Lead	The timer does not exist. There is no scheduler of any kind in the codebase — no cron, no scheduled function, no background worker. The three reminder rules on the Admin screen are checkboxes with nothing behind them. A lead waiting on KYC or a fee waits indefinitely.	MISSING An automatic branch of the diagram never fires.

Lane 6 — Opportunity Creation & Registration

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
AI-05 Generate Opportunity ID, format <code>YYMMNNNNXXX</code> — e.g. <code>2606307RS</code> . IDs only after classification and all mandatory information.	Built exactly to specification, and the ID is displayed as “— withheld —” until every blocker clears. Two caveats: the serial is a global maximum rather than resetting per month, and it is computed from browser state — two people registering at the same moment would generate the same ID. There is no database sequence or uniqueness constraint.	MATCHES — with a collision risk to close
AI-06 Create opportunity folder on SharePoint and CRM software	SharePoint is real and working — Microsoft Graph, folder layout by status and opportunity ID, three standard sub-folders, and folders that move automatically when an opportunity is won or closed. The CRM half does not exist.	PARTIAL
AI-07 Register in CRM & Sales Pipeline (Stage 1)	The registration screen lists this action and labels it “ Simulated ” in the UI. In practice the application <i>is</i> the CRM, so the step is arguably satisfied — but if an external CRM is intended, nothing connects to it.	NEEDS A DECISION
AI-08 Chatbot sends a Microsoft Teams notification to the assigned owner	No Teams integration exists. Teams appears as a status chip on the admin screen and as a line of text on the registration screen that reads “CRM and Teams are simulated in this prototype”. There is no bot, no webhook, no Graph call. Sidebar badge counts are the only notification mechanism in the entire product.	MISSING

Cross-cutting rules from the diagram legend

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
“All activities marked with the Human Validation indicator shall require confirmation through the Microsoft Teams Chatbot before the AI proceeds to the next workflow stage.”	Human validation is real and well designed — but it happens in the web application , through Accept / Edit / Reject controls, not through Teams. This is the diagram’s central control mechanism and it is entirely absent as specified.	DIFFERENT The control exists; the channel does not.
“All AI actions, classifications, assignments, notifications, validations and user interactions shall be logged to maintain a complete audit trail .”	An audit log exists with role, action, object and detail — but it records human actions only . No AI action is logged: not which model ran, not the prompt, not the response, not when extraction was re-run. AI provenance lives on the lead record instead. The log is capped at 500 entries and is client-writable, so it is not tamper-evident.	PARTIAL Not a complete trail as specified.
Fast Track Path for existing Green customers — bypass lead screening, straight to AI parse → ID → folder → Teams notification	Not implemented. A fast-track flag is set on one demonstration lead and read by nothing . A Green customer follows the identical path as everyone else; the only class-based shortcuts in the app are negative ones (Blue blocks, Amber blocks, Red blocks). Green simply has no blockers.	MISSING
“For Greenfield Opportunities, Phase-1 automation concludes at AI-08. But tracking and all customer communication is still included.”	Tracking and communication history are built. However — see Diagram 02 — the app has no notion of Greenfield, so this boundary cannot be enforced.	CANNOT BE ENFORCED

The headline problem. The diagram is organised around one primary split — **Greenfield** (Project, Upgrade) versus **Brownfield** (Retrofit, Service, Spares) — and almost every downstream rule depends on which side an opportunity falls. **That field does not exist in the application.** Searching the source for “brownfield” returns zero results. The earlier clickable prototype this app was ported from *did* carry a Greenfield/Brownfield context on every opportunity; it was dropped during the rewrite and never replaced. Everything in Sections 2, 3 and 7 of the diagram inherits this gap.

Sections 1–3 — Intake and the Greenfield / Brownfield split

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
1. Opportunity created from the lead workflow, folder created, CRM registration, opportunity type identified	All present and carried over correctly from the lead flow.	MATCHES
Opportunity Type splits into Greenfield (Project / Upgrade) and Brownfield (Retrofit / Service / Spares)	No such field. Branching is by an internal route with only three values: Project, Spares, Service. The mapping puts Retrofit and Upgrade both onto the Project route — so Retrofit, which the diagram calls Brownfield, is handled by the same screens as a greenfield project. Flow is also routed to Project.	STRUCTURALLY DIFFERENT
2. Greenfield Phase-1 is deliberately limited: register, maintain details, automated follow-ups and communications, monitoring — explicitly “No Quote / RFQ / Engineering / Pricing at this stage”	The opposite is true: a Project-route opportunity can build a full priced proposal today — bill of quantities, landed cost, margin and a printable quotation. There is no rule preventing it.	CONTRADICTED The app permits what the diagram forbids.
3. Brownfield main flow as five tracked activities — B-01 Requirement Validation, B-02 Technical Evaluation, B-03 Commercial Applicability, B-04 Pricing Validation, B-05 Proposal Generation — each with its own approval, “approved only by the Assigned Salesperson”	No step identifiers, no step state, no per-step approval. Fragments of each activity exist scattered across workbench tabs — a requirement tab, a clarifications table, part matching, price-expiry checks, a proposal section checklist — but nothing records that B-02 was completed, by whom, or when. There is no way to answer “which of the five steps is this opportunity on?”	MISSING The core of the Brownfield lane is untracked.

Section 4 — Service Opportunity, Special Flow

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
Decision: Site Survey Required? → Yes: Generate Survey Request → Site Visit / Survey → Survey Report → Statement of Work → Service Pricing	None of this exists. Searching the entire source tree for “survey” returns zero results . There is no survey-required decision, no survey request, no site visit record, and no survey report. Statement of Work appears only as a <i>heading in the proposal document</i> — there is no SoW record, no SoW approval and no customer sign-off.	MISSING An entire lane is unimplemented.
→ No: Standard Service priced from the Rate Sheet — service rate sheet, travel / lodging, manpower days, consumables	Fully built , and to a good standard: separate India and International rate sheets, and a calculator covering engineer days, travel days, overtime, weekend premium, standby, return flights, hotel nights, local transport, per diem and tools & consumables, with tax and a customer-facing total. A resource-feasibility approval routes to AH, and an unconfirmed travel estimate blocks the proposal.	MATCHES the standard-service half of the lane

Section 5 — Management Approval

This is the second structural divergence. The diagram routes approvals on **order value × margin**. The application routes them on **gross-margin percentage × discount percentage**. These are different variables, different thresholds and different approvers — the implemented rule cannot be reconciled with the drawn one by tuning settings.

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
5A. Technical Approval — approver LJS or AN	A technical deviation approval exists, but it is decided by LJS only . The role “AN” does not exist anywhere in the application — it is not in the role list, the permissions matrix or any seed data. The technical reviewer persona that does exist has read-only rights and cannot approve anything.	DIFFERENT A named approver is missing entirely.
5B. Commercial Approval — approver AH only	Commercial deviation and Amber credit terms both route to AH.	MATCHES
5C. Margin Approval matrix < 10 Lakh & > 50% → Assigned Salesperson < 10 Lakh & ≤ 50% → AH or LJS > 10 Lakh & > 50% → AH + LJS > 10 Lakh & ≤ 50% → AH + LJS	Not implemented. The implemented rule is: margin at or above 25% and discount at or below 5% → LJS alone; margin at or above 20% and discount at or below 10% → LJS alone; otherwise LJS + AH. Order value is calculated and displayed but never used to route an approval , the ₹10 Lakh breakpoint appears nowhere, the 50% margin breakpoint appears nowhere, and there is no tier that lets the assigned salesperson self-approve .	DIFFERENT RULE ENTIRELY
Layered approval is mandatory before the first quote dispatch and for every revision ; all approvals complete → Quote Ready for Dispatch; otherwise Return for Revision	The first-dispatch half is enforced well: quote release is locked until an approval exists, conditions attached to a conditional approval must each be marked incorporated, and a returned approval pushes the opportunity back a stage. The every-revision half is not — see Section 7.	HALF ENFORCED

Section 6 — Quote Dispatch

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
Quote submitted to customer → Customer Acknowledgement → AI starts monitoring, when submitted via Email, Teams, WhatsApp, Customer Portal or Tender Portals	Email only, and not truly automated. Sending opens a pre-filled Gmail compose window in a new tab; the PDF is not attached programmatically — the user prints the document to PDF and attaches it by hand. There is no Teams, WhatsApp or tender-portal dispatch. A customer portal exists and has an “acknowledge receipt” button, but acknowledgement is logged as a single line with no due-date tracking and no gate depending on it.	ONE OF FIVE CHANNELS
A three-point human review before release	Built — release is blocked until three explicit confirmations are ticked.	MATCHES

Section 7 — Negotiation & Revision Loop

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
AI monitors and notifies sales in real time across Email, Teams, WhatsApp, Customer Portal and Tender Portals	Nothing monitors anything. There is no scheduler, no polling, no background job and no alerting path in the entire codebase. Every AI call is request-and-response, triggered by a user clicking a button. Sidebar badge counts, recomputed on each screen render, are the only alerting mechanism.	MISSING
Customer response received? → No → AI follow-up and reminders as per the follow-up plan	An AI-drafted follow-up email exists and a validity countdown is displayed. But sending is simulated, and the three reminder rules — proposal validity warning, Amber fee reminder, approval SLA nudge — are settings toggles with no engine behind them . No reminder has ever fired.	DRAFT ONLY
Identify type of revision: Technical / Commercial / Pricing / Other , each routing back to the matching B-step (B-02, B-03, B-04, B-05)	Revisions carry only a free-text note. There is no revision type and therefore no routing back to any step — which is unsurprising, since the B-steps do not exist either. Revisions are also labelled R1, R2 rather than the V2, V3, V4 in the diagram.	MISSING
Re-Approval Required — repeat Section 5 approvals for every revision	The opposite is enforced. Once a quote has been released, the submit-for-approval action is disabled . A post-release revision therefore cannot re-trigger the approval gate at all — there is no supersede-and-re-approve path. This is the most consequential single gap in the document: a revised price can reach a customer without passing the approval matrix a second time.	CRITICAL
Regenerate Proposal (V2, V3, V4 ...) and compare revisions	The document always re-renders from live data, so regeneration happens implicitly. No snapshot of each revision is stored , and the compare-revisions screen states in its own text that it is a placeholder and that a production system would diff line items, totals and terms.	PARTIAL
Opportunity Won? → No → capture loss reason and close	A close-reason list exists and covers the expected reasons. But closing is just a dropdown edit on the sheet — there is no dedicated close action, no win/loss dialogue, and although the reason is marked required, nothing actually blocks saving a closed opportunity with an empty reason .	NOT ENFORCED

Section 8 — Post-Quote Activities

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
Opportunity tracking — status, stage, probability	Built. Note the app runs two parallel ladders : an eight-value pipeline stage and a separate thirteen-step milestone sequence which is what actually gates the workflow. Probability is a three-band level (Low / Medium / High), not a percentage.	MATCHES
Follow-ups & reminders, AI driven	Drafting yes, firing no — as above.	PARTIAL
Customer communication history, all channels	Built — a per-opportunity timeline of calls, clarifications, submissions, follow-ups and acknowledgements. “All channels” is limited by there being only one channel.	MATCHES
Document & revision history, full audit trail	Proposal-level revision history and a per-opportunity audit tab exist. There is no per-file version history , and the audit log’s 500-entry cap means a busy opportunity’s early history is eventually discarded.	PARTIAL
Competitor tracking	Does not exist. No competitor field, no lost-to-whom capture. Competitors appear only as prose inside free-text remarks.	MISSING

DIAGRAM	WHAT WE ACTUALLY BUILT	VERDICT
Opportunity analytics & reports, dashboard / pipeline	Built and reasonably rich — stage funnel, breakdowns by owner, type and business unit, ageing, win/loss with reasons, and quarterly target versus actual.	MATCHES
Move to next stage — PO received / execution	Built as the tail of the milestone ladder, with a proposal-versus-PO comparison and a handover checklist. Defect found: the handover gate checks for two acceptance flags that the code which records acceptance never writes — it writes two differently named ones. The handover step is therefore unreachable through the interface.	BLOCKED BY A BUG

Consolidated gap register

REF	GAP	CONSEQUENCE IF LEFT AS IS	SEVERITY
01	No Greenfield / Brownfield field; Retrofit and Upgrade both routed to the Project workbench	The diagram's primary branch cannot be honoured. Retrofit opportunities are worked through greenfield screens.	CRITICAL
08	Post-release revisions cannot re-enter the approval gate	A revised price can reach a customer without a second management approval — a direct breach of the diagram's mandatory rule.	CRITICAL
05	Margin approval matrix uses margin × discount, not order value × margin; no salesperson self-approval tier	Approvals route to the wrong people. Large low-margin deals may auto-release; small high-margin deals escalate unnecessarily.	CRITICAL
L3	Region-based ownership is configuration text, not a rule; no region field exists; fallback routes by opportunity type	Leads are assigned by a different rule than the business agreed, and the override is unrestricted and unrecorded.	HIGH
L4 / 09	No Microsoft Teams integration; no server-side email send	The diagram's validation channel and four of five dispatch channels do not exist. Quotes are attached by hand.	HIGH
L5 / 010	No scheduler anywhere — reminders, the one-week KYC/fee expiry and all AI monitoring never fire	Every timed branch of both diagrams is inert. Nothing chases, expires or escalates on its own.	HIGH
03	B-01...B-05 not tracked, no per-step salesperson sign-off	No visibility of where a Brownfield opportunity stands; the revision loop has nothing to route back to.	HIGH
04	Service site-survey sub-flow entirely absent; SoW is a document heading only	Survey-driven service work has no home in the system.	HIGH
02	Greenfield “no pricing at this stage” rule not enforced	Phase-1 scope boundary is not respected.	HIGH
06	Approver role “AN” does not exist	Technical approvals cannot be routed as drawn.	HIGH
L1	No lead-source taxonomy	Channel performance cannot be reported — every lead looks identical in origin.	HIGH
–	Handover milestone gate checks acceptance flags that are never written	The final workflow step cannot be reached. A defect, not a design gap.	HIGH
L2	L-02 / L-03 / D-01 collapsed into a single button	Three agreed checkpoints leave no record.	MEDIUM
L7	Fast Track Path for Green customers not implemented	Repeat Green business gets no advantage over a cold lead.	MEDIUM
L8	KYC is a checklist of document names, not a form	GST and PAN numbers are never captured or validated.	MEDIUM
L6 / L10	No separate discarded-lead database; AI actions not audited; audit capped at 500 entries	“Complete audit trail” and “AI training data” commitments are unmet.	MEDIUM
07	No revision types; labels R1/R2 rather than V2/V3; compare-revisions is a placeholder	Revision cause cannot be analysed.	MEDIUM
011 / 012	No competitor tracking; loss reason not actually enforced on close	Win/loss analysis is incomplete and partly optional.	MEDIUM

REF	GAP	CONSEQUENCE IF LEFT AS IS	SEVERITY
L9	External CRM registration simulated	Only matters if an external CRM is genuinely in scope — needs a client decision.	LOW

Recommended order of work

TIER 1 — DATA-MODEL CORRECTIONS

Small, cheap changes that unblock everything downstream. Restore the Greenfield / Brownfield field on the opportunity and split the routing so Retrofit stops inheriting the Project workbench (O1). Rewrite the commercial gate as the diagram's order-value × margin matrix and add the missing AN approver role (O5, O6). Add a region field to the lead and make the ownership rules an executed lookup rather than a prompt hint, with the override restricted to LJS/AH and a reason recorded (L3). Add the seven-value lead-source list (L1). Fix the handover acceptance-key defect.

TIER 2 — MISSING WORKFLOW OBJECTS

B-01...B-05 as tracked steps with assigned-salesperson sign-off, reusing the approval record already in place (O3). The service site-survey sub-flow feeding the existing rate-sheet calculator (O4). Mandatory re-approval on post-release revision, with typed revisions routing back to the matching B-step (O7, O8). Enforce the loss reason on close and add competitor fields (O11, O12). Enforce the Greenfield no-pricing boundary (O2).

TIER 3 — INFRASTRUCTURE — THE HONEST BLOCKERS

A scheduler, so reminders, the one-week KYC and fee expiry, validity warnings and approval SLA nudges actually fire (L5, O10). A server-side send path that attaches the PDF, plus a Teams webhook — together these unlock the Teams chatbot validation, the AI-08 notification and the multi-channel dispatch lane (L4, O9). A discarded-lead archive and AI-action audit logging (L6, L10). **These items depend on client decisions about hosting and the Microsoft tenancy and should be raised rather than built on assumption.**
